Borrelia burgdorferi migrates into joint capsules and causes an upregulation of interleukin-8 in synovial membranes of dogs
regulation of interleukin-8 in synovial membranes of dogs
INFECT. IMMUN. 55:1273-1285(1997).

-I-FUNCTION: IL-8 IS A CHEMOTACTIC FACTOR THAT ATTRACTS NEUTROPHILS,
BASOPHILS, AND T-CELLS, BUT NOT MONOCYTES. IT IS ALSO INVOLVED IN
NEUTROPHIL ACTIVATION. IT IS RELEASED FROM SEVERAL CELL TYPES IN
RESPONSE TO AN INT-AMMATORY STIMULUS.

INTERLEUKIN-8 PRECURSOR (IL-8) (ALVEOLAR MACROPHAGE CHEMOTACTIC FACTOR
                                                                                                                                                  "Cloning, sequencing, expression and inflammatory activity in skin of ovine interleukin 8.";
IMMUNOL. CELL BIOL. 72:398-405(1994).
-!- FUNCTION: IL-8 IS A CHEMOTACTIC FACTOR THAT ATTRACTS NEUTROPHILS, BASOPHILS, AND T-CELLS, BUT NOT MONOCYTES. IT IS ALSO INVOLVED IN NEUTROPHIL ACTIVATION. IT IS RELEASED FROM SEVERAL CELL TYPES IN RESPONSE TO AN INFLAMMATORY STIMULUS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

J. BIOL. CHEM. 266:8455-8463(1991).
-!- FUNCTION: IL-8 IS A CHEMOTACTIC FACTOR THAT ATTRACTS NEUTROPHILS,
BASOPHILS, AND T-CELLS, BUT NOT MONOCYTES. IT IS ALSO INVOLVED IN
NEUTROPHIL ACTIVATION. IT IS RELEASED FROM SEVERAL CELL TYPES IN
RESPONSE TO AN INFLAMMATORY STIMULUS.

T "CYCOKING-induced neutrophil chemoattractant (CINC)-2 alpha, a novel member of rat GRO/CINGs, is a predominant chemokine produced by lipopolysaccharide-stimulated rat macrophages in culture.";

L BIOCHEM. BLOPHYS. RES. COMMUN. 220:945-948(1996).

- !- FUNCTION: MONOKINE WITH INFLAMMATORY AND CHEMOKINETIC PROPERTIES.

- I- FUNCTION: MONOKINE WITH INFLAMMATORY AND CHEMOTACTIC ACTIVITY FOR MONOCYTEDS, NEUTROPHILS, ESGINOPHILS, BASOPHILS, AND LYMPHOCYTES. REQUIRED FOR LUNG TNF-ALPHA PRODUCTION, NEUTROPHIL RECRUITMENT AND SUBSEQUENT LUNG INJURY AND MAY FUNCTION AS AN AUTOCRINE MEDIATOR FOR THE MARCHARGE PRODUCTION OF TNF-ALPHA WHICH IN TURN UP-REGULATES VASCULAR PRODUCTION MOLECULES REQUIRED FOR NEUTROPHIL INFLUX. THIS PROTEIN
                                                                                                                                                                                                                                                                                                                                                                         BINDS HEPARIN.
INDUCTION: BY LIPOPOLYSACCHARIDE (LPS).
SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CYTOKINE; CHEMOTAXIS; INFLAMMATORY RESPONSE; SIGNAL; HEPARIN-BINDING

```

Statistics: Mean 18.485; Variance 66.275; scale 0.279

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The chemokine MCP-4 receptor - for identifying agonists or antagonists which can be used for treating e.g. infections, allergic PT antagonists which can be used for treating e.g. infections, allergic PT and asthmatic reactions, atherosclerosis and arthritis

Disclosure; Fig 2; 25pp; English.

CC This is the chemokine MCP-4 sequence that can be used in screening cereptor agonists can be identified by contacting a compound with MCP-4 receptor and measuring the change in a functional response or a second concessory system associated with the receptor. MCP-4 receptor is expressed on the surface of a host receptor in combination with the chemokine MCP-4 which may be labelled or unlabelled. The MCP-4 creceptor is expressed on the surface of a host cell or in a membrane or preparation and is used in the form of the isolated protein. It is prepared by transfecting a mammalian cell line with an expression vector comprising a nucleic acid sequence encoding the MCP-4 receptor, and culturing the cell ine in a culture medium. Susceptibility to disease states associated with abnormal expression of the MCP-4 receptor can be contuined using MCP-4, MCP-3, RANTES, MCP-1 or ectaxin. The dentified using MCP-4, MCP-3, RANTES, MCP-1 or ectaxin. The comprisits and antagonists identified can be used for treating disease states associated with the MCP-4 and/Or MCP-3, in a sample taken of from a patient. Neutralising antibodies to the MCP-4 receptor can be states associated with the MCP-4 and/Or MCP-3, in a sample case states associated with the MCP-4 and/Or MCP-3, in a sample case states associated with the MCP-4 and/Or MCP-3, in a sample case states associated with the MCP-4 and/Or MCP-3, in a sample case states associated with the MCP-4 and/Or MCP-3, in a sample case of artising from viral, bacterial and parasital infection, allergic and asthmatic reactions, atheroscialerosis and arthritis. The products can also be used for treating and asthmator of the MCP-4 and/Or MCP-3 and asthmatic reactions, and also produ
                                                                                      ö

Example 11: Fig 5: 83pp; English.

The present sequence is human chemokine betal0 (Ck betal0) or monocyte chemotactic protein 4 (MoP-4) Bac 3 variant, which can be used to treat betalo and season of treat patients deficient in Ck betal0, while a Ck betal0 betal0 can be used to treat leukaemia, solid tumours, chronic or opportunistic infections, autoimmune diseases, asthma, fibrotic diseases, psoriasis and neurodegenerative diseases. It also promotes wound healing, requlates haematopoiesis and generates antibodies. Labelled Ck betal0 can be used to identify its cognate receptor, while cells expressing the receptor can be used to screen compounds for (ant)agonist activity. The antagonist can be used to treat rheumatoid arthritis, autoimmune, chronic inflammatory or infectious diseases, allergies, prostaglandin dependent fever and infectious diseases, allergies, prostaglandin dependent fever and be used to isolate genes encoding similar peptides, in gene therapy and for chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polypeptide encoding chemokine beta 4 and monocyte chemotactic protein 4 - useful to treat tumours, autoimmune disease, infection, asthma and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polypeptide encoding chemokine beta 4 and monocyte chemotactic protein 4 - useful to treat tumours, autoimmune disease, infection, asthma and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 11, Fig 5: 83pp; English.

The present sequence is human chemokine betal0 (CK betal0) or monocyte chemotexic protein 4 (MCP-4) Bac 2 variant, which can be used to treat patients deficient in CK betal0, while a CK betal0 antagonist can be used to reduce excessive levels of CK betal0. CK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         W22672;
19-MAR-1998 (first entry)
Bac 2 chemokine betal0 or monocyte chemotactic protein 4 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               solid tumour; infection; autoimmune disease; asthma; antibody; fibrotic disease; psoriasis; neurodegenerative disease;

The present sequence is human chemokine betal0 (Ck betal0) or monocyte chemotractic protein 4 (MCP-4) Drol1/2 variant, which can be used to treat patients deficient in Ck betal0, while a ck betal0 antagonist can be used to reduce excessive levels of Ck betal0. Ck betal0 can be used to treat leukaemia, solid tumours, chronic or opportunistic infections, autoimmue diseases. It also promotes wound healing, regulates haematopoiesis and generates c antibodies. Labelled Ck betal0 can be used to compension of the cells expressing the arceptor can be used to screen compounds for (ant)agonist activity. The antagonist can be used to creen compounds for (ant)agonist activity. The antagonist can be used to creen treat rheumatoid arthritis, autoimmune, chronic inflammatory or infectious diseases, allergies, prostaglandin dependent fever and bone marrow failure, silicosis, sarcoidosis, hyper-eosinophilic benness, lung inflammation and atherosclerosis Ck betal0 cDNA can
                                                                promotes wound healing, regulates haematopoiesis and generates antibodies. Labelled CK betail can be used to identify its cognate receptor, while cells expressing the receptor can be used to screen compounds for (ant)agonist activity. The antagonist can be used to streat rheumatoid arthritis, autoimmune, chronic inflammatory or inflectious diseases, allergies, prostaglandin dependent fever and bone marrow failure, silicosis, sarcoidosis, hyper-eosinophilic syndrome, lung inflammation and atherosclerosis. Ck betall cDNA can and for chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Droll/2 chemokine betail or monocyte chemotactic protein 4 variant. Human; chemokine betail or betail treatment; antagonist; solid tumour; infection; autoimmune disease; asthma; antibody; fibrotic disease; psoriasis; neurodegenerative disease; wound healing; haematopoiesis regulation; gene therapy; chromosome identification; monocyte chemotactic protein 4; leukaemia; MCP-4; Droll/2 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptide encoding chemokine beta 4 and monocyte chemotactic protein 4 - useful to treat tumours, autoimmune disease, infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              used to isolate genes encoding similar peptides, in gene therapy
betal0 can be used to treat leukaemia, solid tumours, chronic or opportunistic infections, autoimmune diseases, asthma, fibrotic diseases, psoriasis and neurodegenerative diseases. It also

increase resistance to infection

Claim 7; Page II-12; Apply English.

The present sequence represents a chemokine, CKbeta-10, which is capable of mobilising stem cells. The chemokine can be used therapeutically to of mobilising stem cells. The chemokine can be used therapeutically to stem cell mobilisation, optionally together with a colony stimulating factor or other hematorequiatory agent. It can be used wherever an increased level of haematopoietic cells is needed, e.g. to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              increase the immune response to chronic infection (particularly bacterial or parasitic), to promote wound healing, in (transplant) patients with reduced bone marrow function as a result of immunosuppressive treatment or disease, and to provide more rapid regeneration of bone marrow after treatment for neoplastic or viral diseases. The induced stem cells may be harvested for subsequent return to the patient, optionally after they have been genetically manipulated to deliver a selected gene product (gene therapy). The cells may be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polypeptide encoding chemokine beta 4 and monocyte chemotactic profein 4 useful to treat tumours, autoimmune disease, infection, asthma and fibrosis Example 11; Fig 5; 83pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W22671;
19-MAR-1998 (first entry)
Bac 1 chemokine beta10 or monocyte chemotactic protein 4 variant.
Bac 1 chemokine beta10 or monocyte chemotactic protein 4 variant.
Human; chemokine beta10; Ck beta10; treatment; antagonist;
solid tumour; infection; autoimmune disease; asthma; antibody;
fibrotic disease; psoriasis; neurodegenerative disease;
wound healing; haematopoiesis regulation; gene therapy;
chromosome identification; monocyte chemotactic protein 4;
leukaemia; MCP-4; Bac 1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ten new chemokine(s) able to mobilise stem cells – used where increased levels of haematopoietic cells are required, e.g. to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Monocyte chemoattractant proteins, MCP-4 and MCP-3 - used to develop products for treating e.g. cancers, infections, asthma, cystic fibrosis, rinitis, atherosclerosis or inflammatory bowel disease claim 8; Page 53: 106pp; English.

The present sequence represents human monocyte chemoattractant protein 4 (MCP-4). The MCP-4 and MCP-5 have activity in stimulating chemotactic activity. The MCP-4 and MCP-5 have activity in stimulating chemotactic activity. The MCP-4 and MCP-5 have activity in stimulating chemotactic lymphoma (e.g. Hodgkin's lymphoma), a plasmacytoma, a melanoma, a sarcoma, a tumour within the lung or gastrointestinal tract, or infectious disease such as AIDS or malaria. Antagonists to the proteins can be used for treating e.g. asthma, chronic obstructive pulmoary disease, cystic fibrosis, sinusitis, rhinitis, atherosclerosis, glomerulonephritis, multiple sclerosis, inflammatory bowel disease, carthritis or adult respiratory distress syndrome. Infections such as parasitic infections may also be treated with a molecule that inhibits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;
0
              monocyte chemotactic protein 4 (MCP4) Bac I variant, which can be used to treat patients deficient in Ck betal0, while a Ck betal0 and antagonist can be used to reduce excessive levels of Ck betal10. Ck betal10 can be used to treat leukaemia, solid tumours, chronic or opportunistic infections, autoimmune diseases, asthma, fibrotic diseases, psoriasis and neurodegenerative diseases. It also promotes wound healing, requlates haematopoiesis and generates antibodies. Labelled Ck betal0 can be used to identify its cognate receptor, while cells expressing the receptor can be used to screen compounds for (art)agonist activity. The antigonist can be used to treat rheumatoid arthritis, autoimmune, chronic inflammatory or infectious diseases, allergies, prostaglandin dependent fever and come marrow failure, silicosis, sarcoidosis, hyper-eosinophilic syndrome, lung inflammation and atherosclerosis. Ck betal0 cDNA can be used to isolate genes encoding similar peptides, in gene therapy and for chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Claim 1, Fig 2; 81pp; English.

The present sequence is human chemokine betal0 (Ck betal0) or monocyte chemotractic protein 4 (McP-4), which can be used to treat patients deficient in Ck betal0, while a Ck betal0 antagonist can be used to reduce excessive levels of Ck betal0. Ck betal0 can be used to reduce excessive levels of Ck betal0. Ck betal0 can be used to treat leukaemia, solid tumours, chronic or opportunistic infections, autoimmune diseases, asthma, fibrotic diseases, poriasis and neurodegenerative diseases. It also promotes wound calling, regulates haematopoiesis and generates antibodies.

Labelled Ck betal0 can be used to identify its cognate receptor, while cells expressing the receptor can be used to screen compounds for (ant)agonist activity. The antagonist can be used to treat rheumatoid arthritis, autoimmune, chronic inflammatory or infectious diseases, allergies, prostaglandin dependent fever and bone marrow failure, silicosis, sarcoidosis, hyper-eosinophilic syndrome, lung inflammation and atherosclerosis. Ck betal0 cDNA can be used to isolate genes encoding similar peptides, in gene therapy and for chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein 4 - useful to treat tumours, autoimmune disease, infection, asthma and fibrosis
            19-MAR-1998 (first entry)

Human chemokine betal0 or monocyte chemotactic protein 4.

Human; chemokine betal0, Ck betal0; treatment; antagonist;

Solid tumour; infection; autoimmune disease; asthma; antibody;

fibrotic disease; psoriasis; neurodegenerative disease;

wound healing; haematopoiesis regulation; gene therapy;

chromosome identification; monocyte chemotactic protein 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polypeptide encoding chemokine beta 4 and monocyte chemotactic

This polypeptide comprises human macrophage-derived monocyte chemotactic protein-5 (MCP-5), a novel C-C chemokine. Its amino acid sequence was deduced from a cDNA clone (see T90880 and T90883) isolated from a human macrophage cDNA intransformed and T90881 isolated from a human macrophage cDNA clones a monocyte coll that is stably transformed or transfected with MCP-5 polynucleotide. Also claimed is a hybridoma that produces a monochonal antibody (MAb) that is specifically reactive with the mature MCP-5 (Or its analogues and fragments) is used to enhance the immune response in cases of rounds or infections, while its inhibitors (e.g. the MAb) are useful as anti-inflammatories in cases of e.g. arthritis and crohn's disease, also for treatment of atherosclerosis, angiogenesis and tumour growth (or metastasis). The MCP-5 inhibitors can possibly also be used to reduce the damaging effects of chemo- and radio-therapy on myeloid progenitor cells, and to inhibit replication of HIV. MCP-5 can also be used to identify the creeptors) are used to modulate MCP-5 agonists and antagonists.

A novel human chemoxine, Ck beta-10 (R93087), was identified as the product of a cDNA clone (717050) isolated from a 9-wk early the product of a cDNA library. The protein is structurally related to the chemoxine family. Recombinant Ck beta-10 can be obtd. By incorporating the cDNA into a vector and expression of the protein

receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammation sites. MCP-1 has been implicated in allergic and chronic inflammatory diseases e.g. arthritis, arteriosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably providing 50% inhibition of binding at a 25:1 ratio or less, compared with 75:1 for prior art mutant 7ND.
                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents an analogue, MCP-1 (10-76), of monocyte chemostractant protein-1 (MCP-1). The analogue, which lacks the N-terminal amino acids 1-9 of MCP-1, acts as an antagonist of MCP-1 as it lacks MCP-1 biological activity and inhibits binding to a MCP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
in e.g. E. coli, COS or Sf9 cells. Ck beta-10 can be used to treat solid tumours, chronic infections, psoriasis, asthma and allergy, to regulate haematopoiesis, promote wound healing, and to inhibit angiogenesis. It can also be used to inhibit bone marrow stem cell colony formn. during chemotherapy.
                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Truncated monocyte chemoattractant profein-1; inhibitor; receptor binding; anti inflammatory; basophil; lymphocyte; allergy; chronic inflammatory disease; arthritis; arteriosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Monocyte chemoattractant protein analogue MCP-1 (11-76).

The present sequence represents an analogue, MCP-1 (11-76), of monocyte chemocattractent protein-1 (MCP-1). The analogue, which lacks the chemocattractent protein-1 (MCP-1), acts as an antagonist of MCP-1 as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 creceptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammation sites. MCP-1 has been implicated in allergic and chronic inflammatory diseases. The analogue competes more effectively with MCP-1 for binding diseases. The analogue competes more effectively with MCP-1 for binding MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably with 75:1 for prior art mutant 7ND.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents an analogue, MCP-1 (9-76), of monocyte chemoattractant protein-1 (MCP-1). The analogue, which lacks the chemoattractant protein-1 (MCP-1). The analogue, which lacks the N-terminal amino acids 1-8 of MCP-1, acts as an antagonist of MCP-1 as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammation sites. MCP-1 has been implicated in allergic and chronic inflammatory diseases e.g. arthritis, artreiosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably with 75:1 for prior art mutant 7ND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-terminally truncated monocyte chemo:attractant protein-1 (MCP-1) - lacks MCP-1 activity and inhibits receptor binding, useful as anti-inflammatory agent claim 7; Page 5; 27pp; English.

This particular protein protein (MCP-1) derive. - are capable of inhibiting the monocyte chemo-attractant activity of capable of inhibiting the monocyte chemo-attractant activity of endogenous MCP-1 and can be used to treat restenosis claim 4; Page 11; 22pp; English.

Solution of the control of the control of the control of the chemoattractant activity of endogenous MCP-1, provided that the derivative has not been modified by the substitution of 28 Tyr by Leu and/or 30-Arg by Val. Preferred mutations by Phe; (3) substitution of 28 Tyr by aspartate; (2) substitution of 24 Arg by Phe; (3) substitution of 3-Asp by Ala; and/or (4) deletion of amino acids 2-8. The present sequence is a specifically claimed human MCP-1 acids 2-8. The present protein disclosed in Rollins, Molecular and Cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

The peptides can be used to prevent restenosis, e.g. in patients squence 69 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         POWER C.A., MEYER A., RISON S.C.G., GUYE-COULIN F., WELLS T.N.C.;
SUBMITTED (DEC-1997) TO EMBL/GENBANK/DDBJ DATA BARKS.
-!- FUNCTION: CHEMOTACTIC FACTOR THAT ATTRACTS MONOCYTES, LYMPHOCYTES,
BASOPHILS AND EOSINOPHILS, BUT NOT NEUTROPHILS. SIGNALS THROUGH
CCR2B AND CCR3 RECEPTORS. PLAYS A ROLE IN THE ACCUMULATION OF
LEUKOCYTES AT BOTH SIDES OF ALLERGIC AND NONALLERGIC INFLAMMATION.
MAY BE INVOLVED IN THE RECRUITMENT OF MONOCYTES INTO THE ARTERIAL
WALL DURING THE DISEASE PROCESS OF ARTHEROSCLEROSIS. MAY PLAY A
ROLE IN THE MONOCYTE ATTRACTION IN TISSUES CHRONICALLY EXPOSED TO
                                                                                                                                                                GARCIA-ZEPEDA E.A., COMBADIERE C., ROTHENBERG M.E., SARAFI M.N.,

CHEMOKINE THAT SIGNALS THROUGH CCR2. INVOLVED IN ALLERGIC INFLAMMATION AND THE HOST RESPONSE TO PATHOGENS AND MAY PLAY A PLYOTAL ROLE DURING EARLY STRAGES OF ALLERGIC LUNG INFLAMMATION.

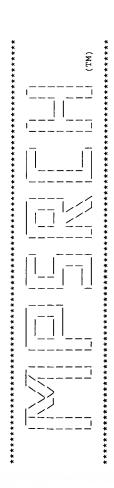

-!- SUBUNIT: HOWODIMER (BY SIMILARITY).

-!- TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN THE LYMPH NODES AND THYMOS. ALSO FOUND IN THE SALIVARY GLANDS CONTAINING LYMPH NODES, BREAST, HEART, LUNG, BRAIN, SMALL INTESTINE, KIDNEY AND COLON.

-!- INDUCTION: BY IFFN-GAMMA AND LIPOPOLYSACCHARIDE (LPS).

-!- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C.C.) (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                     Screening for cpds. with anti-heparanase activity - by detecting inhibition of heparin or heparan sulphate degradation, potentially useful for treating arthritis, restenosis, cancer. Claim 13; Page 50; 60pp; English.

Purified heparanases, prepared under reducing conditions and activated with transglutaminase, are given in R70786-801. Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into pVil392 baculovirus vector, and expression in Sf9 cells in the presence of reduced glutathione and dithiothreitol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New monocyte chemo:attractive cytokine - for treatment of cancer

The present sequence represents an analogue, MCP-1 (10-76), of monocyte chemoattractant protein-1 (MCP-1). The analogue, which lacks the chemoattractant protein-1 (MCP-1), acts as an antagonist of MCP-1 as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammatory diseases e.g. arthritis, arteriosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding (MCP-1 inceptors than prior art mutant versions of MCP-1 e.g. preferably providing 50% inhibition of binding at a 25:1 ratio or less, compared Squence 66 AA;

receptor binding; anti inflammatory; basophil; lymphocyte; allergy;
chronic inflammatory disease; arthritis; arteriosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             N-terminally truncated monocyte chemo:attractant protein-1 (MCP-1) lacks MCP-1 activity and inhibits receptor binding, useful as
2-myristate-3-acetate (see Q25259). The mature protein is claimed. It can be N-terminally deleted such that the mature protein starts at Val 3 or at Lys 19. The leader sequence is active in animal cells. See Q25258-Q25262.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó

The present sequence represents an analogue, MCP-1 (9-76), of monocyte chemoattractant protein-1 (MCP-1). The analogue, which lacks the chemoattractant protein-1 (MCP-1). The analogue, which lacks the N-terminal annio acids 1-8 of MCP-1). The analogue is useful as an antagonist of MCP-1 as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammatory diseases e.g. arthritis, arteriosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably with 75:1 for prior art mutant 7ND.

Sequence 68 AA;
                                                                                                                                                      The present sequence represents an analogue, MCP-1 (11-76), of monocyte chemoattractant protein-1 (MCP-1). The analogue, which lacks the chemoattractant protein-1 (MCP-1). The analogue, which lacks the N-terminal amino acids 1-10 of MCP-1, acts as an antagonist of MCP-1 as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammatory diseases e.g. arthritis, arteriosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably providing 50% inhibition of binding at a 25:1 ratio or less, compared with 75:1 for prior art mutant 7ND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-terminally truncated monocyte chemo:attractant protein-1 (MCP-1) - lacks MCP-1 activity and inhibits receptor binding, useful as
                                                                           N-terminally truncated monocyte chemo:attractant protein-1 (MCP-1) - lacks MCP-1 activity and inhibits receptor binding, useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps

The monocyte chance attractant protein-1 (MCP-1) derivs. - are apable of inhibiting the monocyte chemo-attractant activity of and can be used to treat restenosis activity of endogenous MCP-1 and can be used to treat restenosis activity of endogenous MCP-1 and can be used to treat restenosis activity of endogenous concepts chemoattractant protein-1 (MCP-1) derivatives are mutated such that they inhibit the monocyte chemoattractant activity of endogenous competitution of 28-tyr by Leas not been modified by the competitution of 28-tyr by aspartate; (2) substitutions concepts and control of 28-tyr by aspartate; (2) substitution of 24 Arg concepts and cellular sequence is a specifically clearmed human MCP-1 acids 2-8. The present sequence is a specifically claimed human MCP-1 and Cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

The peptides can be used to prevent restenosis, e.g. in patients so sequence 69 AA;

chemoattractant protein-1 (MCP-1). The analogue, which lacks the N-terminal amino acids 1-7 of MCP-1, acts as an antagonist of MCP-1 as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammation sites. MCP-1 has been implicated in allergic and chronic inflammatory diseases e.g. arthritis, arteriosclerosis and several lung MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably with 75:1 for prior art mutant 7ND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

Preferred mutations are: (1) substitution of 28-Tyr by aspartate; (2) substitution of 24-Arg by Phe; (3) substitution of 3-Asp by Ala; and/or (4) deletion of amino derivative based on the parent protein disclosed in Rollins, Molecular The peptides can be used to prevent restenosis, e.g. in patients

Anti-sense Monocyte Chemotactic Protein-1 oligo:nucleotide(s) -
useful for therapy or diagnosis of restenosis, etc.
Disclosure; Column 13-14; 16pp; English.
This is the amino acid sequence of the human monocyte chemoattractant
Protein (MCP)-1, a member of the C-C chemokine family. MCP-1 is a potent
stimulator of monocyte chemotaxis and is produced by injured vascular
smooth cells thus attracting monocytes and macrophages which infiltrate
the injured area and release growth factor. This causes proliferation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the injured area and release growth factor. This causes proliferation of the vascular smooth cells resulting in restenosis. The gene sequence can be used to generate antisense sequences e.g. T48093-7, which can be used to inhibit in vitro MCP-1 produ. by mononuclear cells e.g. lymphocytes or macrophages, or smooth muscle cells, esp. in order to prevent vascular
                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                   therapeutic effect on skin wounds and ulcers.

Disclosure: Page 12; 22pp; Japanese.
The invention relates to a new remedy for curing wounds which, instead of comprising a growth factor, comprises a monocyte chemotactic activating factor (MOAF) or its variants or derivatives. The factor has potent effect on skin wounds and ulcers. The present sequence is human MCAF, the activity of which is exemplified as the new remedy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                             ó
Radio.labelling neutrophil-activating peptide(s) - for imaging targetted delivery of radioactive agent with a represents mature human monocyte chemoattractant protein-1 will represents mature human monocyte chemoattractant protein-1 (MCP-1). MCP-1 was radionuclide labelled and used in a method for imaging a target site in vivo in an animal. Labelled MCP-1 was allowed to accumulate at a target site (having MCP-1 receptors) in the animal can detected so as to image the target site. Any Cys-Cys or Cys-Xaa-Cys chemokine carrying either iodine-123 or iodine-131 can be used in the method. Especially preferred is neutrophil activating peptide-2 (NAP-2) which recognises interleukin-8 receptors and is labelled with the technetium-99m, indium-111, coppers of infection, inflammation, in negation or restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Macrophage chemoattractant peptide designated GDCF-2.

Disclosure; page 3: 46pp; English. Peptide is derived from glioma cell line U-105MG (ATCC CRL9932) or from Peptide is derived from glioma cell line U-105MG (ATCC CRL9932) or from leukocytes and has mol. wt. 8400. Used to treat infections and neoplasms.
                                                                            Claim 1: Column 27: 21pp; English.

The present sequence represents a monocyte chemoattractant peptide (MCP) and present sequence represents a monocyte chemoattractant peptide (MCP) designated GDCF-2. MCPs can be isolated from human gliona cell line U-105MG (e.g. present sequence) and peripheral blood mononouclear leukocytes. MCPs are used for the treatment of neoplasms and infections in humans. Short peptides derived from MCPs can be screened to identify those that can bind to the monocyte receptor without stimulating a chemotactic response. These are potentially useful for treating inflammation associated with monocyte infiltration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptide with specific chemotactic activity for monocytes - isolated from glioma or leucocyte cells, useful for treating infections and

PT Anti-sense monocyte chemotactic protein-1 oligo:nucleotide(s) and peptide(s) - is used for inhibiting, treating or imaging areas of PT vascular restenosis or potential restenosis

PT vascular restenosis or potential restenosis

CC The sequences given in R53398-99 represent sense and antisense CC monocyte chemotactic protein-1 (MCP-1) respectively. These oligonucleotides may be labelled with a radionuclide and use CC monocyte and peptide antisense MCP-1 compounds may be constructed using high energy alpha or beta emitting isocopes rather than the gamma enitters cutomarily used for diagnostic purposes. Antisense MCP-1 compounds inactivate MCP-1 or inhibit production of MCP-1 so that monocytes are not attracted to the area of vascular injury and sequence 76 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 25.627; Variance 32.369; scale 0.792

eosinophils in allergic inflammation.";
BIOCHEMISTRY 37:11670-11678-11989.
-!- FUNCTION: IN RESPONSE TO THE PRESENCE OF ALLERGENS, THIS PROTEIN
DIRECTLY PROMOTES THE ACCUMULATION OF EOSINOPHILS, A PROMINENT
FEATURE OF ALLERGIC INFLAMMATORY REACTIONS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -:- SUBCELLULAR LOCATION: EXTRACELLULAR.
-:- PTH: O-GIYCOSTLATED (PROBABLE).
-:- INDUCTION: BY THY-ALPHA, IL-1-ALPHA AND INTERFERON GAMMA.
-:- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).
